Technologies

- React.js
- Node
- Express
- Google Auth
- Chat Feature - chat with landlord
- Back-up library, package or technology:
 - Fetch
- Background check API - <https://www.backgroundcheckapi.com>
- MongoDB and Mongoose
- Heroku

1. An overview of the intended application and WHY you feel it's valuable.

A web application that connects landlords with qualified renters in the Denver area. Landlords can post their listings they have available. There will also be a chat feature so they can chat with the landlord in real time about the listings they have available. In order for the renter to apply to rent an apartment/home/room they will need to pass a background check. Landlord know they are only dealing with serious and qualified renters.

2. A set of DETAILED screen-by-screen design layouts with annotations describing all UI/UX components and all data relevant to the screen. - **Saved to github documentation**

3. Flow Chart - **Saved to github documentation**

4. A breakdown of roles by group member - **see project management board (Asana)**

5. A schedule for completion of various tasks - **see project management board (Asana)**

6. A screenshot of your Project Management Board that shows breakdown of tasks, assigned to group members with a schedule - **Saved to github documentation**
